softwareQ: How to find
the memory footprint of
our web app Is there any
tool or technology to find
the memory footprint of
our web app? We are
using JSP /Servlet +

Hibernate and MySQL on GAE server. Please let me know any similar tools or technology.

Thank you. A: GAE doesn't give you enough information to accurately estimate the memory usage of your application. It will give you the memory used by Java, the server process, and any operating

system processes. The app itself will use memory, but that memory isn't visible to you in GAE. It can be used by the JVM to store data in memory, and it can also be used by the Java interpreter or JVM. Realistically, you're probably better off estimating based on other factors. If you have

a server with a lot of memory and you're just running a single web application, you might be able to guess at what your usage should be. You can also use your server's top application monitoring utilities to estimate the memory usage, if you're willing to run that on your server. Note that even if you

could work out how much memory your application was using, it wouldn't necessarily translate into real RAM usage because the JVM will only use so much of the memory at a time. You'd have to check what the heap size of your JVM is, which you can do with the following JVM command: java

-Xms2g -Xmx2g
-XX:+PrintFlagsFinal
-version That will display
the heap size specified
on the command line.
You want to find the Xmx
parameter. Q: Ada
design pattern: passing
variables across a
process boundary There
are multiple documents
on this pattern in the
Ada world, which are all

really, really good. I don't know if they are called in a different way, but they all seem like a variation on the following: The main unit is extended to be able to create a variable that can be referenced by other units. I've also seen the following: The main process creates a private unit that contains

a public variable. But I
am not really sure how
to distinguish

The MS Word file repair tool is designed to recover the contents of corrupt files in.docx format, saving you from losing work and data. You can recover your files from a corrupted.docx or.doc file after loading the corrupted document into

SysInfoTools MS Word Docx Files Repair. Two different file recovery modes are available: standard and advanced. ... The standard mode extracts image and text from the corrupt MS Word file and then saves them to the specified location. For a successful recovery of data you must open the corrupted

file in the same order as the program was opened. Using the advanced mode, the program starts the document scanning with a set of predefined paths and scans the whole corrupted file (even the hidden data), simultaneously extracting the necessary data and saving them to

the specified location. This version of the tool is more effective for the recovery of large corrupt files. Advanced mode supports recovery of the content of Word files with macro viruses and includes a built-in anti-virus engine. FILED NOT FOR PUBLICATION OCT 18 2012 MOLLY C. DWYER, CLERK UNITED
